Vivek H. Rajpara

GENERATIVE AI & BACKEND SOFTWARE ENGINEER

linkedin.com/in/vivek-rajpara-gen-ai | rajparavivek1234@gmail.com | Ahmedabad, India | rajparavivek1234.github.io/portfolio

Winner, Yuno Agents Hackathon 2026 (team of three) with the **Feature ETA Agent**, an LLM agent that turns a feature request into a defensible delivery date (P50/P80/P95). Each team member was awarded 5,000 Yuno ESOPs.

Professional Summary

Generative AI and backend engineer who builds LLM agents that do real production work, and the Go payment systems they work on. At Yuno (payment orchestration) I own payment-provider and fraud integrations end to end and act as a primary responder for production incidents. I designed a suite of ~20 Claude Code agent skills that takes a production ticket from Jira, Slack and Datadog evidence to a root cause, a test-driven fix, a staging-verified pull request and an evidence report, with human approval before anything merges or is sent. That suite is how I authored 350+ PRs, reviewed 700+ and closed 470+ production tickets in one year. Experienced in Go, Python, Node.js and Rust, distributed systems, real-time analytics pipelines and workflow automation.

Technical Skills

Generative AI:	LLM agent design & tool use, Claude Code skills / subagents / hooks, MCP integrations, LangGraph, Anthropic & OpenAI APIs, Prompt Engineering, LLM evals (judge models, golden sets), guardrails & human-in-the-loop, LLM classification
ML & Research:	Monte Carlo simulation, PERT estimation, XGBoost, MLflow, Optuna, walk-forward validation, permutation tests
Languages:	Go, Python, Node.js, JavaScript, Rust, SQL
Frameworks:	Express.js, Echo, Actix Web, FastAPI
Databases:	MySQL, PostgreSQL, MongoDB, Redis, CockroachDB, ClickHouse
Event Systems:	Kafka, NATS
Infrastructure:	Docker, Kubernetes, GCP, Datadog (logs, APM, monitors), Drone CI, Git, Postman
Payments:	Cards, 3DS 2.x, network tokens, Apple Pay / Google Pay, stored credentials (CIT/MIT), webhooks, PCI vault, chargebacks, PIX / UPI
Arch. & Concepts:	OOPs, SOLID, Microservices, RESTful APIs, Concurrency, Multithreading, Distributed Systems
Testing:	TDD, mutation testing, Cucumber, Chai, Postman

Experience

Software Engineer – Backend & AI, Yuno (Payment Orchestration) Sep 2025 – Present

- **Hackathon-winning Feature ETA Agent:** co-built (team of three) one agent with 11 skills and 4 Python engines on the company agent platform. The LLM reads the ticket, maps teams and dependencies and asks at most five questions. Deterministic engines compute PERT effort, 2,000 Monte Carlo simulations for P50/P80/P95 dates, the critical path and RICE/WSJF priority, with 42 checks per step. Nothing is written to Jira or Slack without human approval.
- Built the agent's evaluation suite: 71 cases run three times each and judged by a separate model across seven behaviours (correctness, clarification, no fabrication, grounding, scope refusal). Raised the score from 0 to 0.99–1.00 over 21 runs in one day.
- **On-call agent suite:** designed ~20 Claude Code skills (ticket diagnosis, payment and webhook forensics, alert triage, connector fixes with TDD, staging verification, PR review, release approval, deploy monitoring), with verify-first and post-gate guardrails so agents never report state from memory.
- Built a hands-off E2E payment bot that drives provider redirects and 3DS OTP challenges in headless Chrome, and a deploy-monitor agent that compares old and new versions (error mix, p95/p99 latency, 5xx, decline mix) during canary rollouts.
- Design and implement payment provider integrations across cards, wallets, QR and redirect flows, including QI Cards with 3DS, Wompi–Nequi (Direct), Monnet (QR, Wallet, Cards), ZainCash V2, Tabapay, AllInPay and NHN KCP (Korea). Onboarded Monri and payabl into the PCI egress proxy.
- Build and maintain fraud and risk integrations with Forter, Signifyd, Riskified, ClearSale and Yuno Fraud Screening, covering screening, fulfillment, refund and chargeback feedback flows.

- Fixed network-token and stored-credential flows (cryptograms, DPAN MITs, Apple Pay / Google Pay, CIT/MIT chains) across Stripe, Airwallex, PayPal, Nuvei, Unlimint, emerchantpay and dLocal, restoring failed recurring charges.
- Act as a primary Integrations contact for merchant-facing incidents: webhook 5xx spikes (including a self-amplifying retry loop), signature verification failures, decline-code mapping errors, provider timeouts and callback-URL failures across Stripe, Adyen, Airwallex, PayPal, dLocal, Mercado Pago, PagSeguro and Pinbank. Every fix ships with staging before/after traces.
- Participate in integrations on-call rotations, coordinating with DevOps and SecOps. Handled a multi-provider egress outage RCA and fixed a settlement duplicate-submission race with compare-and-set.
- Security hygiene: removed cleartext credentials from HTTP logs in three connectors, and drove SQL-injection remediation across 10 repos, open-redirect fixes across 6 and Go toolchain CVE bumps.

Software Engineer, Rapidops Inc. (Salesmate – CRM) Jan 2023 – Aug 2025

- Engineered a high-performance email synchronization pipeline in Go (IMAP / Gmail / Outlook), reducing sync latency by 30% and improving reliability at scale.
- Integrated LLM-based email classification for spam and transactional/promotional detection, increasing triage efficiency by 40%; implemented phishing and malicious-URL detection.
- Contributed to Smart Flow & AI Agent, a no-code automation system executing 100K+ workflows per day, building backend logic for triggers, conditions, branching and action execution.
- Designed and maintained real-time analytics pipelines using Kafka ingestion and ClickHouse for CRM reporting and insights.
- Refactored performance-critical Node.js services into Go, reducing CPU usage and improving response times.
- Hardened REST APIs against SQL injection and unauthorized access; built secure CSV/Excel imports with rollback, deduplication and GDPR-compliant updates.
- Developed a document management system with role-based access control and password-protected sharing; implemented Deal Split Credit logic and automated thumbnail generation.

Projects

Nexus — Multi-Agent Research Platform (Python, LangGraph, FastAPI, XGBoost, MLflow) 2026

- 24 agent modules (scanner, signal generator, risk guardian with veto, bull/bear debate, explainer, journal) on a LangGraph state graph; ~248k lines of Python, 1,862 commits, 321 test files; paper trading only.
- Research gauntlet of walk-forward splits, permutation tests and random-entry controls that rejects strategies which only look good in a plain backtest.

go-idempotency-middleware (Go, standard library) 2026

- HTTP idempotency-key middleware so a retried POST never executes twice: 409 for concurrent duplicates, 422 for key reuse with a different body, bounded race-clean store and a black-box conformance tester.

E-Movie Platform (MERN) Feb 2023 – Apr 2023

- Full-stack movie platform using React, Node.js, MongoDB and the TMDB API, with JWT/OAuth 2.0 authentication.

E-Transportation App (Flutter) Jul 2022 – Nov 2022

- Ride-booking app with real-time tracking, Razorpay in-app payments and Google Geolocation routing.

Education

B.Tech in Information Technology Jul 2019 – Jul 2023

Dharmsinh Desai University, Gujarat · CGPA: 7.9 / 10

Awards & Certifications

Winner, Yuno Agents Hackathon 2026 (Feature ETA Agent), awarded 5,000 ESOPs

Docker Mastery: with Kubernetes + Swarm from a Docker Captain — Udemy
