Vivek H. Rajpara

Generative AI & Backend Engineer — Agentic Systems · LLM Tooling · Payments in Go

rajparavivek1234@gmail.com · Ahmedabad, India · IST, EU overlap · Remote · linkedin.com/in/vivek-rajpara-gen-ai · rajparavivek1234.github.io/portfolio

🏆 **Winner, Yuno Agents Hackathon 2026** (team of three) with the **Feature ETA Agent**, an LLM agent that turns a feature request into a defensible delivery date (P50/P80/P95). Each team member was awarded 5,000 Yuno ESOPs.

SUMMARY

AI-native backend engineer who builds LLM agents that do real production work, and the Go payment systems they work on. At Yuno (payment orchestration) I own processor connectors end to end: request builders, tokenization and PCI-vault connectivity, status and decline mapping, webhooks and reconciliation. I designed a suite of ~20 Claude Code agent skills that takes a production ticket from Jira/Slack/Datadog evidence to a root cause, a test-driven fix, a staging-verified PR and an evidence report, with human approval gates before anything merges or is sent. My agent design rules: the model reads and explains, deterministic code calculates, and people decide.

350+	700+	470+	55+	~20
PRs authored, 45+ repos	PRs reviewed	production tickets closed in 12 mo	processors, wallets, 3DS & fraud providers	agent skills designed

SKILLS

Generative AI & agents	LLM agent design & tool use, Claude Code skills / subagents / hooks, MCP integrations (Jira, Confluence, Slack, GitHub, Datadog, Glean), LangGraph, Anthropic & OpenAI APIs, prompt design, LLM evals (judge models, golden sets, consistency), guardrails & human-in-the-loop gates, grounding / anti-hallucination, LLM classification pipelines, headless-browser agents
ML & research	Monte Carlo simulation, PERT estimation, XGBoost, MLflow, Optuna, walk-forward validation, permutation tests, random-control baselines, pandas
Payments domain	Auth / capture / void / refund / verify, 3DS 2.x, network tokens (Visa VTS, Mastercard MDES), Apple Pay / Google Pay, CIT/MIT stored credentials, subscriptions & rebills, chargebacks & fraud feedback, PIX / UPI / SPEI / open banking, PCI vault & egress proxy, idempotency & retries
Languages	Go (primary), Python, Node.js / JavaScript, Rust, SQL; reads Kotlin
Platform	Kubernetes, Docker, Kafka, NATS, PostgreSQL, Redis, MongoDB, ClickHouse, FastAPI, Datadog (logs, APM, monitors), Drone CI, GitHub, GCP
Practice	TDD, mutation testing, staging before/after evidence with trace IDs, RCA write-ups, on-call & incident response, credential redaction, CVE remediation

EXPERIENCE

Software Engineer, Integrations — Yuno (payment orchestration)

Sep 2025 – Present · Remote

Own Go processor connectors from build through production; primary Integrations responder for merchant-facing incidents; built the team's agent tooling.

- **Hackathon-winning Feature ETA Agent.** Co-built (team of three) one agent with 11 skills and 4 Python engines on the company agent platform. The model reads the ticket, maps teams and dependencies and asks at most five questions. The engines compute PERT effort, a schedule, 2,000 Monte Carlo simulations giving P50/P80/P95 dates, the critical path and RICE/WSJF priority, with 42 checks at every step. Nothing is written to Jira or Slack without human approval. Verified with 71 eval cases run 3× each, judged by a separate model across seven behaviours (correctness, clarification, no fabrication, grounding, scope refusal…); the eval score went from 0 to 0.99–1.00 over 21 runs in one day.
- **On-call agent suite.** Designed ~20 Claude Code skills (diagnosis, payment/webhook forensics, alert triage, connector fix with TDD, staging verification, PR review, release approval, deploy monitoring) that pull evidence from Jira, Slack, Datadog, databases and code. Verify-first and post-gate rules stop the agents stating anything from memory or repeating settled questions. Result: 350+ PRs and 700+ reviews in a year while raising the evidence bar.
- **Autonomous QA and monitoring agents.** A hands-off E2E payment bot creates payments via the API, drives provider redirects and 3DS OTP challenges in headless Chrome, polls to a final status and collects Datadog evidence.

A deploy-monitor agent compares old and new versions (error mix, p50/p95/p99 latency, 5xx rates, decline mix, resource use) against last week's baseline during canary rollouts.

- **Gateway adapters.** Built processor adapters end to end: QI Cards with 3DS (Iraq), Monnet card redirect, Wompi–Nequi, ZainCash, Tabapay, AllInPay. Completed NHN KCP (Korea: card, bank transfer, carrier billing, webhook reconciliation of lost approvals). Onboarded Monri and payabl into the PCI egress proxy, and added card verification and wallets to Merchantware, Kushki, Worldpay and Nuvei.
- **Tokenization, mapping & webhooks.** Fixed network-token flows (cryptograms, DPAN MITs, Apple/Google Pay DSRP + ECI) across Airwallex, emerchantpay, Nuvei, Unlimint, PayPal and dLocal. Own status and decline mapping into the unified taxonomy (Stripe network-code-first; timeout vs. terminal for Rede, Cielo, PayPal). Hardened webhooks for Adyen, Airwallex, Mercado Pago, Stripe, dLocal and others: idempotent acks, 3DS/PIX expiry fallbacks, and removal of a self-amplifying 5XX retry loop.
- **Reliability & security.** 470+ tickets closed in 12 months, including a multi-provider egress outage RCA, a settlement duplicate-submission race (compare-and-set fix) and stuck-refund pollers. Fixed stored-credential chains that broke recurring charges (Stripe, Airwallex, Unlimint, PayPal, Adyen UPI Autopay). Removed cleartext credentials from logs in three connectors, and drove SQL-injection fixes across 10 repos and open-redirect fixes across 6.

Software Engineer — Rapidops Inc. (Salesmate CRM) Jan 2023 – Aug 2025 · Ahmedabad

- **LLM features.** Integrated LLM-based email classification (spam, transactional vs. promotional) plus phishing and malicious-URL detection, raising triage efficiency ~40%.
- **Go email-sync pipeline** (IMAP / Gmail / Outlook): cut sync latency ~30%; refactored performance-critical Node.js services into Go to reduce CPU and response time.
- **Smart Flow & AI Agent:** backend for a no-code automation engine running 100K+ workflows a day (triggers, conditions, branching, actions).
- **Data & security:** real-time analytics (Kafka into ClickHouse); secure CSV/Excel import with rollback, de-duplication and GDPR updates; REST APIs hardened against SQL injection; role-based document sharing.

SELECTED PROJECTS

Nexus — multi-agent research platform for markets Personal · 2026

Python, LangGraph, FastAPI, XGBoost, MLflow, Optuna, Kafka, Redis, TimescaleDB, Next.js

24 agent modules (scanner, signal, risk guardian with veto, bull/bear debate, explainer, journal, retrainer) on a LangGraph state graph; ~248k lines of Python, 1,862 commits, 321 test files; trades on paper only. Its research gauntlet (walk-forward splits, permutation tests, random-entry controls) rejects strategies that only look good in a plain backtest.

go-idempotency-middleware Go, stdlib only

HTTP idempotency-key middleware: a retried POST never executes twice. Concurrent duplicates get 409 and key reuse with a different body gets 422; the record store is bounded and race-clean, with a black-box conformance tester.

EDUCATION

B.Tech, Information Technology — Dharmsinh Desai University, Gujarat
2019 – 2023 · CGPA 7.9 / 10

CERTIFICATIONS & EXTRAS

Docker Mastery: Kubernetes + Swarm (Udemy)
Earlier: Flutter ride-booking app (Razorpay), MERN movie platform (JWT / OAuth 2.0)
